Learning for Performance: A Guide and Toolkit for Health Worker Education and Training Programs

*Learning for Performance* is an instructional design process that is targeted to fix a performance problem or gap when workers lack the essential skills and knowledge for a specific job responsibility, competency or task. *Learning for Performance* uses an instructional design process and practical tools to focus training and education on essential content, effective methods and job performance. The process can be used to develop learning interventions of any scale. Originally published in 2007 in hard copy by the Capacity Project and IntraHealth International, the web version of the toolkit was published online in 2008 at the web address provided below. IntraHealth produced the interactive web version of *Learning for Performance* to enable users to easily access the content of the publication, its tools and links to references and resources. The site provides links to related publications on other web sites and links to where to obtain hard copies of the toolkit.
